BINOMIAL RELIABILITY TABLE

NAVWEPS Report 8090 (NOTS TP 3140) is published by the Test Department. It consists of 167 leaves. First printing, January 1964, 170 copies. Second printing, January 1982, 50 copies.

BINOMIAL RELIABILITY TABLE

FOREWORD

The Binomial Reliability Table is presented for use in the reliability estimation of such items as missiles and electronic components when the data have been classified by attributes. The body of the table contains lower one-sided confidence limits; the sample size n ranges from 4 to 500 in unit increments; the number of reliable items, r, ranges from $n/2$ to n when n is even and from $(n-1)/2$ to n when n is odd. The six confidence levels (80, 90, 95, 97.5, 99, and 99.5%) chosen for this table are those which the authors feel are most commonly used in reliability prediction.

This more-comprehensive table supersedes a similar tabulation which was incorporated in an advance copy of Section 4.8—4.15, NAVORD Report 6575 (unpublished), entitled "Statistical Treatment of Reliability Estimates From Binomial Populations". It is presented in book form for use as a readily available reference in reliability engineering and related fields.

The table was computed on the IBM 7090 calculator; IBM tabulation sheets were used as reproduction copy. Cost of preparing the table, including computer rental, was supported by Station general overhead funds.

This publication has been reviewed for technical accuracy by E. A. Fay and C. T. Messinger.

INTRODUCTION

The Binomial Reliability Table has been prepared to assist engineers, statisticians, and mathematicians in the reliability estimation of missiles, rockets, electronic components, and the like, when the data have been classified by attributes. It gives the lower one-sided confidence limit on the true population reliability p (proportion of reliable items in the population) for six confidence levels—80, 90, 95, 97.5, 99, and 99.5%.

In this compilation, p is given to five decimal places; the range of n (sample size) is 4 through 500 by ones; the range of r (number of reliable items found in a sample of size n) is $n/2$ through n by ones when n is even, and $(n-1)/2$ through n by ones when n is odd.

THE BINOMIAL DISTRIBUTION

The binomial distribution emerges as a useful model in various scientific disciplines. Experiments which yield attribute data (e.g., favorable or unfavorable, success or failure, reliable or unreliable, etc.), can often be analyzed using this distribution as the underlying probabilistic model. The binomial distribution is defined as

$$p(x) = \binom{n}{x} p^x (1-p)^{n-x} \qquad (1)$$

n = number of items tested

p = proportion of favorable items in population

x = number of favorable items obtained in a sample size n

Equation (1) gives the probability of obtaining exactly x favorable items from a sample of size n when the true population proportion of reliable (favorable) items is p.

In order to use the above distribution as our probabilistic model, the following assumptions must be made:

1. The population is very large (infinite) in size. Thus, if the population is infinite, the probability of a favorable event, p, remains constant from sample to sample. For finite populations, Eq. (1) is only approximately correct; the accuracy of the approximation improves with increasing population size.

2. The sample is randomly selected from the population. That is, every item in the population must have the same probability of being chosen for the sample.

CONFIDENCE LIMITS

From the results of testing a random sample of size n we wish to predict the true population p. From our sample we obtained r favorable events. An estimate $\hat{p}$ of the true population p is given by r/n. When sampling from a population it seems obvious that it would be extremely unlikely if this sample estimate were exactly the true population p. Indeed, since we cannot test the entire population, we can never know the exact value of p. However, we can construct an interval which will contain p most of the time. The wider the interval, the greater the probability that p will be con-

tained in it; i.e., we can be more *confident* that p lies within this interval. To construct this interval, the end points, commonly called *confidence limits*, must be found. In calculating confidence limits, the cumulative form of the binomial distribution, $F(x)$, is used.

$$F(x) = \sum_{x=r}^{n} \binom{n}{x} p^x (1-p)^{n-x} \tag{2}$$

Equation (2) gives the probability of obtaining r or more favorable items from a sample of size n when the true percent of favorable items in the population is p.

The upper and lower confidence limits are obtained by solving the following equations for p_u and p_ℓ, respectively[1].

$$\sum_{x=0}^{r} \binom{n}{x} p_u^x (1-p_u)^{n-x} = (1/2)(1-\gamma) \tag{3}$$

$$\sum_{x=r}^{n} \binom{n}{x} p_\ell^x (1-p_\ell)^{n-x} = (1/2)(1-\gamma) \tag{4}$$

γ = the desired confidence (confidence coefficient)
p_u = upper confidence limit
p_ℓ = lower confidence limit

With fixed r, n, and γ, and by trial and error or other appropriate methods[2], p_u and p_ℓ can be determined. Having the values of p_u and p_ℓ, we can state with a specified confidence (γ) that the true population p will not be less than p_ℓ nor greater than p_u in the precise sense that, if an infinite number of samples of size n is tested and the number of successful items r_i, $i = 1, 2, \ldots$ is determined, the computed confidence limits p_{u_i} and p_{ℓ_i} will be such that $100\gamma\%$ of the time $p_{\ell_i} \leq p \leq p_{u_i}$. Thus, when we assign gamma to be .90, if we test many samples of size n and compute confidence limits each time, the interval between these limits will contain p about 90 times out of 100.

However, in reliability prediction, the upper two-sided confidence limit is of little interest. Generally, we are interested not in how good the item could be, but rather in what is the worst that can be expected. Therefore, instead of two-sided confidence limits, we use a lower one-sided limit. The lower one-sided confidence limit is obtained by solving the following equation for p_ℓ:

$$\sum_{x=r}^{n} \binom{n}{x} p_\ell^x (1-p_\ell)^{n-x} = 1-\gamma \tag{5}$$

p_ℓ = lower one-sided confidence limit

From our sample of size n, we obtained r reliable items. Given γ and solving for p_ℓ, we can now make the following statement: We are $100\gamma\%$ confident that the true population proportion of reliable items p is equal to or greater than our lower one-sided confidence limit p_ℓ.

USE OF TABLE

Example 1

A sample of size 50 is randomly selected from a population whose reliability we wish to predict. Forty-eight of the items tested are successful. Using the table, find a lower confidence limit so that the true population p will be equal to or greater than this value 90% of the time; i.e., if many samples are drawn and a lower confidence limit is computed from each sample, 90% of the time we would be correct in stating that the true population p is equal to or greater than this lower limit.

[1] For the mathematical derivation of these equations, see *Introduction to the Theory of Statistics*, by Alexander McFarlane Mood. New York, McGraw-Hill, 1950, pp. 220–244.

[2] One method is to use Pearson's tables of the incomplete beta function. For large values of n the normal approximation to the binomial can be used.

Looking in the table for $n = 50$, $r = 48$, $\gamma = .90$ (page 7) we find that the lower limit is .89704.

Hence, we are 90% confident that the true population reliability is at least .89.

Example 2

A sample of size 50 is tested, 2 failures occur. Using the table, find an upper limit q, such that we are 90% confident that no more than q proportion of the population will be defective, where $q = 1 - p$.

Looking in the table for $n = 50$, $r = (50 - 2) = 48$, and $\gamma = .90$ we find a value .89704. Then $(1 - .89704) = .10296$ which is the upper 90% confidence limit for the proportion of defectives in the population.

CALCULATION OF TABLE

Throughout the following discussion, it will be convenient to use the notation

$$B(p:n,r) \text{ denotes } \sum_{x=r}^{n} \binom{n}{x} p^x (1-p)^{n-x} \tag{6}$$

The lower one-sided confidence limits given in the table were computed on the IBM 7090 using floating-point arithmetic. Given n, r, and γ the program solved the following equation for p_ℓ:

$$\sum_{x=r}^{n} \binom{n}{x} p_\ell^x (1-p_\ell)^{n-x} = 1 - \gamma = a \qquad p_\ell = \text{lower, one-sided confidence limit} \tag{7}$$

A table of log factorials[3] was incorporated into the program. With the use of these logarithms, a table of

$$\frac{n!}{x!\,(n-x)!}$$

with x ranging from $1/2n$ to n, was generated for each n.

Given n, r, and γ, an iterative procedure was used to determine p_ℓ. For each value of r, the p_ℓ corresponding to each γ level was computed. When $r = n$, p_ℓ was solved directly from the equation

$$\log p_\ell = \frac{\log a}{n} \tag{8}$$

When $r < n$, the first estimate $\hat{p}_\ell$ of p_ℓ was obtained from previously computed values. For example when $n = 50$, $r = 49$, and $\gamma = .80$, the first estimate for p_ℓ was the value previously computed for $n = 49$, $r = 48$, and $\gamma = .80$.

The iterative procedure consisted of finding the value of p_ℓ, such that the following would hold:

$$\sum_{x=r}^{n} \binom{n}{x} p_\ell^x (1-p_\ell)^{n-x} = a \pm \epsilon(a) \quad \text{where } \epsilon(a) < 10^{-5} \tag{9}$$

Having the first estimate $\hat{p}_\ell$ and by use of the Taylor series, the following equation was solved for Δp:

$$a = B(\hat{p}_\ell:n,r) + B'(\hat{p}_\ell:n,r)\,\Delta p + \frac{B''(\hat{p}_\ell:n,r)\,(\Delta p)^2}{2!} \tag{10}$$

[3] Owen, D. B. and C. M. Williams, *Logarithms of Factorials from 1 to 2000*, Sandia Corporation Monograph SCR-158, Albuquerque, N. M., December 1959.

BINOMIAL RELIABILITY TABLE

That value of Δp, which minimizes $|\alpha - B(\hat{p}_\ell : n, r)|$, was the root used to correct $\hat{p}_\ell$.

The new estimate $\hat{p}_\ell$ was formed by adding Δp to the last estimate $\hat{p}_\ell$. The process was repeated until

$$|\alpha - B(\hat{p}_\ell : n, r)| < 1 \times 10^{-5} \tag{11}$$

at which time $\hat{p}_\ell$, which had been carried to 8 decimal places in the IBM 7090 calculations, was rounded and printed in the body of the table.

ACCURACY OF TABLE

Since the tabular values of $\hat{p}_\ell$ have been rounded to 5 decimal places, the error in α (introduced by the round-off process) is generally greater than 1×10^{-5}. Nevertheless, the maximum error in α is still equal to or less than $.005\alpha$.

The tabular values of $\hat{p}_\ell$ are accurate in the sense that

$$B(\hat{p}_\ell : n, r) = \alpha \pm \epsilon(\alpha) \text{ where } \epsilon(\alpha) \leq .005\alpha \text{ and } \alpha = 1 - \gamma$$

Thus, although the heading reads $\gamma = .800, .900, .950, .975, .990$, and $.995$, when using the table it is to be understood that

$$\gamma - \epsilon(1-\gamma) \leq \gamma \leq \gamma + \epsilon(1-\gamma)$$

That is, when the table heading reads:	The actual value is:
γ	$\gamma - \epsilon(1-\gamma) \leq \gamma \leq + \epsilon(1-\gamma)$
.800	$.799000 \leq \gamma \leq .801000$
.900	$.899500 \leq \gamma \leq .900500$
.950	$.949750 \leq \gamma \leq .950250$
.975	$.974875 \leq \gamma \leq .975125$
.990	$.989950 \leq \gamma \leq .990050$
.995	$.994975 \leq \gamma \leq .995025$

Also, it is to be noted that $.005\alpha$ is an upper bound on $\epsilon(\alpha)$. However, in many entries in the table, $\epsilon(\alpha)$ is equal to or less than $.002\alpha$.

This degree of accuracy is very acceptable. The advantages gained in listing p to more decimal places and doing the added computations necessary to make $\epsilon(\alpha)$ smaller would have had very little practical value.

INITIAL DISTRIBUTION

5 Chief, Bureau of Naval Weapons
- DLI-31 (2)
- R (1)
- R-14 (1)
- RRRE-41 (1)

1 Chief of Naval Research (Code 104)
1 David W. Taylor Model Basin
1 Naval Avionics Facility, Indianapolis (Library)
1 Naval Missile Center, Point Mugu (Technical Library)
1 Naval Ordnance Laboratory, Corona (Library)
1 Naval Ordnance Laboratory, White Oak (Library)
1 Naval Postgraduate School, Monterey (Library)
1 Naval Research Laboratory (Code 2021)
1 Naval Underwater Ordnance Station, Newport (Library)
1 Naval Weapons Laboratory, Dahlgren (Technical Library)
2 Naval Weapons Service Office, Naval Air Engineering Center, Philadelphia
1 Navy Electronics Laboratory, San Diego (Library)
2 Aberdeen Proving Ground
- Ballistic Research Laboratories (1)
- Development and Proof Services (1)

3 Army Missile Command, Redstone Arsenal
- Rocket Development Laboratory, Test and Evaluation Branch (1)
- Redstone Scientific Information Center (2)

1 Diamond Ordnance Fuze Laboratory (Library)
2 Frankford Arsenal
- Library (1)
- Pitman-Dunn Laboratory (1)

1 Picatinny Arsenal (Library)
1 Rock Island Arsenal (Library)
1 White Sands Missile Range (ORDBS-Technical Library)
1 Air Force Missile Development Center, Holloman Air Force Base (Library)
1 Defense Atomic Support Agency, Sandia Base (Development Division)
10 Defense Documentation Center (TISIA-1)
5 Manned Spacecraft Center, Houston (Flight Worthiness Branch, Spacecraft Technology Division, Franklin Complex D)
- Mark T. Lee (2)

1 Applied Physics Laboratory, JHU, Silver Spring (Document Library)
1 Cornell University, Ithaca (Engineering Department, Dr. Henry P. Goode)
1 Institute of Science and Technology, The University of Michigan, Ann Arbor (Technical Documents Services)

1 Jet Propulsion Laboratory, CIT, Pasadena (Dr. W. H. Pickering)
1 Los Alamos Scientific Laboratory, N. Mex. (Edward A. Voorhees)
1 New York University, College of Engineering
1 Sandia Corporation, Albuquerque (Donald B. Owen)
1 Stanford University, Stanford, Calif. (Statistics Department, Dr. Herbert Solomon)
1 The Rand Corporation, Santa Monica, Calif. (Paul Armer)
1 United Technology Corporation, Sunnyvale, Calif. (Merritt M. Goff)
1 University of California at Los Angeles (Engineering Department, Dr. Edward P. Coleman)
1 University of California Lawrence Radiation Laboratory, Livermore (Library)
1 Australian Joint Service Staff (Australian Weapons Research Establishment) via BuWeps (DSC)
